## **Abstract**

Health Center of Excellence - is defined as interconnected collaborative centers of professional knowledge and skills, which have common applicability to the benefit of all nations in South East and Western Europe. We speak here specifically of medical diagnostic, remote health care and training through knowledge sharing and second opinion which will facilitate effective healthcare knowledge deployment without undue concern for distance and local institutional resource. Specific goals: Health Centers of Excellence can foster South Eastern Europe development and interaction and establish better cooperation among people within and beyond borders, especially in education and health-sciences. Collaborating HCE through their interaction are important to develop mutual respect, thereby to change attitudes of the past. Knowledge sharing in Radiology, Pathology, Cardiology, Dermatology, etc. as well in other health sciences, will bring professionals of the SEE countries closer to each other and to West Europe. This will enable and truly simplify their integration into the broader Europe Community. Knowledge/skills sharing, interaction and collaboration could help overcome animosities from the past and create better environment in a common future. Strategic Goals: The human mind is the most complex information-processing tool we have. It is our goal to create intellectual product/s that can make sustainable and collaborative intellectual service for health professionals and patients. Currently major investments in health are made in infrastructure and technology. Every day we are becoming more dependent on technology and machines. Intellectual/professional products and services are less important. In many cases experts are push or left aside. Dependence on technology is becoming compulsory and essential. In the years to come the human service and product will become less needed. Patients are those who are suffering the most. The confidence can be lost, because the machine is put between the medical doctor and the patient. Large amount of money will be spent for the service that can be offered in the country or through the network of HCE experts. It is our experience that the things we know have great practical value only if they are shared.
