## **Abstract**

In recent years the long-term sustainable development based on natural, human and economic potential that owns every space has become a very important area of study for the science of geography. The concept of sustainable development is being discussed by competent and incompetent people, but the question is to find better ways of this kind of development. Although sustainable development is an important issue in the global and national scale, it has its specifics and challenges in different regions or countries. So, in this context, it happens the same thing with our territory which we are studying. The coastal space Ishem- Porto Romano, possesses important natural and human potentials. This potential is particularly important for the region and at the same time attractive to investors and tourists, bearing in the mind that within a relatively small radius, the area offers great opportunities for the development of agriculture, tourism (marine / coastal, cultural, eco-tourism, agricultural) and energy. During this decade, the area is being involved in an integrated development through the development of the tourism industry, agriculture and energy. There are compiled a lot of plans and projects and also, in the same time, is being invested towards this development as in elite tourism, biopark and in building of energy park. The study which is being presented has as its purpose the discussion of alternatives that this area offers for a sustainable development, based on natural and human resources. For the implementation of the project we are based on the analysis of project plans, field observations, surveys, questionnaires, consultation and analysis of national strategies for sustainable development.

**Keywords:** *Coastal space, alternatives, sustainable development, tourism, project plan*
