Abstract

Education is a right of every child of every community and every country which they should practice and benefit for a better future.. Education is the key element in helping men and women developing their full potentials to a successful future. Learning opens doors of opportunity that are only available to those who seek it out and put their hearts and souls into it. Through education and becoming exposed to added knowledge and experiences, people can find themselves what they are best suited for or interested in doing for the rest of their lives. Success definition differs for every person and education plays a crucial role in both creating a personal definition of success and eventually making it reality. It is an important tool for beating poverty and one of the greatest investments human kind can make to achieve global prosperity. Education transforms countries and societies; it is a grown fact that an extra year of quality schooling lifts a country's annual economic growth. Educated children are more family oriented and achieve better employment opportunities and results during adulthood. It is not enough just making the decision of taking advantage of all education opportunities, it takes effort to seek out those opportunities that could potentially help to further develop talents and abilities that may be already in which one of us. Education is not limited to school buildings and institutions. Even if a great deal of learning can come from teachers, professors, books, and classrooms, these are not the only avenues of education and should not be seen that way. Any way or manner a person can benefit to educate themselves or learn more about the world around represents a better opportunity and chance that would help carry up the career ladder. It is handy into the realms of success by improving and expanding the quality and quantity of connection circles and how fast one can think and solve problems as well as generate new ideas. Those who can work independently and can be counted on in the toughest and most trying situations. This category will be most sought out by the professional world, without mattering whether it was: carpentry, engineering, teaching, medicine, etc. In order to get a good education it is not enough getting by and passing classes in school it should be put a great deal of effort into and make the most of it. People should, must be willing to learn new ideas, try new concepts, and experiment with what we are unfamiliar. When the empower of thyself is pursued to fully live up thy definition of success then the contribution to the world around each one of us is achieved through full potential.

Keywords: Education, Right, Freedom, Potential, Future

Introduction

Education is often the best tool for creating wealth and happiness. Education can help your long-term economic prospects and help you to obtain, keep, and maintain a home or business in the future. Education is a right; it's the key to a better childhood, and a better future for children, their communities and their countries. It is the responsibility of the state and a core element of any development policy committed to social justice. Yet for many children worldwide, the right to education remains unfulfilled.

Education is the key to a successful future and the key element in helping men and women developing to their full potentials. Learning opens doors of opportunity that are only available to those who seek it out and put their hearts and souls into it. Through education and becoming exposed to added knowledge and experiences, people can find for themselves what they are best suited or most interested in doing for the rest of their lives. Success is defined differently by every person and education is an important tool in both creating a personal definition of success and eventually making it reality.

Education is fundamental to everything we do. It is the key to beating poverty and the greatest investment we can make for global prosperity and the future of our world. Education transforms countries and societies; an extra year of quality schooling lifts a country's annual economic growth.

Educated children are able to take better care of their families and find greater employment opportunities in adulthood.

Making the decision to take advantage of all educational opportunities that are available is not something that is necessarily easy, oftentimes it takes effort to seek out those opportunities that could potentially help to further develop talents and abilities that we may already possess.

Education is not limited to Education Institutes

Education is not limited to school buildings and institutions. While a great deal of learning can come from teachers, professors, books, and classrooms, these are not the only avenues of education and should not be seen that way. Any way a person can educate themselves or learn more about the world around them is key in establishing a successful career and future. It's rarely the knowledge and facts that you know that carry you up the career ladder and into the realms of success but rather than connections you make with others and how fast you can think on your feet and solve problems and generate new ideas. Those who can work independently and can be counted on in the toughest and most trying situations are those that will be most sought out by the professional world, whether that profession happens to be carpentry, engineering, teaching, medicine, or anything else.

Simply getting by and passing classes in school is not enough. In order to get a good education, we have to put a great deal of effort into it and make the most of it. We have to be willing to learn new ideas, try new concepts, and experiment with what we are unfamiliar. Education is the key to success because everything involved in the process of education involves the intake of new knowledge, the application of new techniques, and the connection of new information with what we already know or have experienced. When we allow

ourselves to be exposed to new knowledge and experiences, we then empower ourselves to fully live up to our own definition of success and contribute to the world around us to our fullest potential.

Education and Every Day Life

In the era of knowledge information and communication technology learning must be characterized by the following key features: Become a purposeful life activities for all people without exception, which take place with the pace and direction set by the individual, depending on his needs and requirements, which may change during the life;

- To extend the time throughout life, "from the cradle to the grave", periodically or discontinued;
- To be wide, taking place in formal and informal, in all existing facilities (education and training, employment, housing and public);
- To affect all aspects of public and private life, with the aim of improving knowledge, skills and competences within a personal perspective, civic, social and work;
- To develop using all possible resources and tools, as traditional as well as new ones, electronics (Multimedia, Internet), to reveal opportunities for his revolution.

In this way, the future society everyone must become a student of life and all human society in a society that learns or student. Thus, the concept "student" is getting more and more sense of "fit man" and is gradually loses meaning "scholar" or "trainee".

What should be done

However, society must establish comprehensive opportunities for individuals to learn and to encourage and motivate them to use these opportunities to improve their position in society, the aim of self-realization, irrespective of their social and educational level. More serious attention is paid to the individual today is explained by several factors, economic, social and technological.

First, today in any modern economy realization of products and services to the greatest extent depends on human capital rather than physical one, i.e. depends on the knowledge and experience of the employees individually and collectively.

Secondly, the knowledge society and information and communication technology people can cope with life and work successfully if they are able to take progressively more responsibility for self directed learning, which is key to guide their future development. Third, today's information technologies and communication, particularly those based in the Internet (or Intranet), provide great opportunities to learn individually, both within and outside educational institutions and training.

Education for all "is a global response to major changes, rapid and continuous economic, social, cultural and technological, reflecting in full and comprehensive needs of individuals, society and the economy.

In terms of sociopolitical education is seen as a crucial factor for the development of complete individuals, to increase opportunities (opportunities) to their employment opportunities to expand the choice of professional career change by them, for increased welfare and their permanent integration in economic and social life of contemporary society.

Education is seen as a very important factor for the development of society, achieving of social cohesion, strengthening of democracy and justice, reducing inequalities and differences between individuals of different groups, avoiding social isolation and poverty reduction. In this way, education is not any longer a luxury but it becomes an investment company for its future, so the future society will be a "company fit". In this society, "every individual is given the opportunity to reach a broad base of knowledge and develop his skills in order to provide employment and participation in economic life. This broad base of knowledge is important for everyone to avoid the division of society into those who know and those who do not have them. "

Education, aiming at establishing an organic unity between the needs of society and the economy, on the one hand, and development of the individual, on the other hand, it is also one of the ways to realize the ideas of humanism education, putting human in its center. Western sociologists as opposed teknokratizimit society, which often turns only man in the car rider and spiritually impoverishes it, have long agreed that the alarm whistle industrial propaganda purpose mainly develops in humans "have" (to win) rather than "being". Therefore the developed industrial countries examined stereotypes substantially located in the area of relations "education-society-production", aimed, first of all, removing the traditional technocratic approach to the education of the individual. In the foreground is placed man, his personality, and requires no human adaptation and education to manufacturing, engineering and concrete technology, even more, where individual personality as a service to the scientific and technical progress, but otherwise, the target output continuously increasing educational level of its participants. "The mission of vital important education is to help each to develop his individual potential and become the perfect man, in contrast to the human imagination as an instrument in the service economy, gaining skills and knowledge must go hand in hand with the formation of character, expand horizons and take upon themselves the responsibility to society. "

It is understood that in terms of a high percentage of unemployment, massive involvement of young people in higher education is a handy tool to reduce social tensions, but this is temporary. Many young people will suffer disappointment if, at the end of the study, they will not find work as they received diplomas. This will lead to an increase in their desire to emigrate, and the lack of motivation to later generations of students, seeing that diploma will receive will not serve to exercise appropriate professional activity, but only to have a higher status. This would not push them a little, as it is currently, that, to gain this status, ask them not to buy can earn a university degree, which to us, as it seems, is not so difficult .

In connection with the view according to which a high level of education of the population is beneficial, regardless of needs, even if this thesis stand, I think, at least for now, it should be applied in a selective manner, taking into account areas development priorities of the country or those who have the greatest need. It should also be applied at rates in line with economic and social development of the country and not "neck down" quality. Quality assurance is an essential part of an effective education system that can not be ignored.

The impact of Education in Albania

Like any other nation, our nation can not survive without high appreciation of our shared liberal society, without patriotism, without preparing our citizens to fulfill their duties or to assume responsibility in the country or nation and has not solidarity. Our history is fraught with great experience and achievement in science and art, economics and politics. We have a

remarkable tradition of rule of law, constitutional government and a good administrative system. We have created a welfare state and have developed a market economy. For decades now we have lived in peace and sustainable democracy as an essential part of the European family of nations and have reached our peaceful reunification.

Education is the key to opportunities in life for each person and is of great importance to preserve the values - and the values that we wish to cultivate. Stability and prosperity can only be provided with more education for more people. It will enable us to overcome future challenges and seize the opportunities change.

Freedom and human dignity, property and the full range of human possibilities can be realized if the talents and skills of young people promoted, sought and developed from the beginning. Desire and ability to perform can be nurtured in a spirit of discovery and curiosity climate even outside school premises.

The social background of a person would not be the deciding factor for his future. "Career advancement through education" is our goal socio - political. Everyone should be involved. No one should be left behind. Poverty often begins as lack of education. Participation in education and training is a necessity of equal opportunities.

Social security and social cohesion require that we train children to become strong personalities, who believe in their abilities, learn to show consideration for others and are able to accept responsibility and demonstrate solidarity.

Thanks to a system of fair and effective education will be able to transmit and maintain those values which are the foundation of prosperity and security. Education is of strategic importance to broadcast our moral and economic values.
