Abstract

In this paper we shall discuss the phenomenon of topicalization in Albanian language in a descriptive way. Topicalization is one of the types of constructions that represent a marked word order different from the normal Albanian words order in which, it is accepted that it is free. It has been found that topicalized sentences are recognized as a kind of segmented sentences. In their treatment originally distinguished them from other types in terms of the presence or not of pronoun reversal. The constructions can not have topicalized pronominal reversal, otherwise the sentence comes not gramatical. Also distinguished for the fact that in these constructions require that topicalized element necessarily be preceded by the preposition, if it is required by the verb from which it depends. In these constructions one of the components of the phrase placed at the beginning of the sentence and otherwise disrupted by topic and shift to the left here this element that is placed at the beginning of the sentence does not come as Reme topic but as we come to understand that this element is only Reme data gives us context. This type is called contrastive topicalization discerning which only makes the contrast difference or dealing with what we have given the context. In the above issues it has been talked a bit about the types of sentences that through emphasizing their component by emphasis, we make it possible to reject a previous sentence, although without using negative particles. By observing topicalization phenomenon could further clarify this kind of denial. This phenomenon is studied to identify the syntactic constructions that represent different aspects of the displacement components in the simple sentence. The conclusions reached in this work opens new perspectives in the study of marked constructions in Albanian language.
