Abstract

The television world is more beautiful and interesting than the real. This study was realized to see how the long hours that children spend in front of television affect their behaviour. The aim of this paper is to explore the virtual behavior in the children and consequences. The hypothesis for this study is: "children who spend many hours a day before television are more likely to exhibit aggressive behavior". The goal of realizing this study is to prove if there is a connection between the hours that children spend in front of television and the aggressive behavior. The study reveals this context through the literature used to complete this paperwork and by means of two questionnaires to measure this phenomenon. Its aim was to ensure more specified information related to the risen hypothesis to prove it true or not. The questionnaire was addressed to 100 children from 12 to 14 years old. The result showed a correlation between the aggressive behavior and the long hours that children spend in front of television.

Keywords: *television, aggressive behavior, negative effects*
